

Final WOMT Summary for 4/7/09:

The Projects will implement the FWS determination as follows: 1) OMR will be maintained at or less negative than -4000 cfs on a 14-day average for the next week and 2) OMR flow objective will be set at -3000 cfs if any detection of larval delta smelt occurs at either salvage facility. If the detection of larval delta smelt occurs at either salvage facility, the Smelt Working Group will reconvene and potentially make further recommendations. Also, the Smelt Working Group will continue to monitor the delta smelt salvage and will reconvene and potentially make further recommendations should a one-day, combined expanded salvage of adult delta smelt reach 20 or greater.

DFG deems no special action is necessary for the protection of longfin smelt at this time.

WOMT plans on a call on Thursday, April 9th, at 3:30pm, to finalize the timing and export levels for the upcoming VAMP.
